Explanation of Facets:

- Fretful:** People with avoidant personalities often feel uncomfortable on an everyday basis as they have a tendency to worry about things that others do not. Avoidant individuals tend to interpret events anxiously and view innocent comments as criticisms or signs of ridicule. They usually feel hesitant, restless, and nervous at the prospect of engaging in everyday situations since they are wary that they may say or do the wrong thing or that something threatening will happen.
- Distracted:** Individuals with avoidant features tend to feel distracted, a consequence of generally feeling unsafe in the world. They may warily scan the environment for potential threats and are often preoccupied by random thoughts that intrude on their minds, while events around them that are uncontrollable or unfamiliar may distress them and cause them to lose focus. Consequently, this hyper-vigilance tends to negatively impact their thought continuity, social communications, and focused judgments.
- Aversive:** People with avoidant traits often dislike engaging in activities that involve social interactions since they are terrified of the ridicule, scorn, or criticism that others might level at them in such situations. Even as the avoidant individual seeks acceptance and friendships, he or she is often unwilling to get involved in unfamiliar social settings unless they can be sure they will be liked. As a consequence, avoidant people tend to maintain a distance between themselves and others to avoid potential humiliation.
- Alienated:** Avoidant individuals often feel alienated from those around them since they tend to struggle with perceptions of themselves as inferior and socially inept. Feeling inadequate, devalued, unattractive, or rejected thus spurs the avoidant person to isolate themselves, fostering feelings of emptiness, sadness, and loneliness.
- Fragile:** One characteristic of the avoidant personality is being fragile. This often manifests as being hypersensitive to criticism or negative comments, as well as putting an excessively negative spin on things other people have said about them. People who are high in this trait are very self-conscious and easily hurt or embarrassed, and they tend to misinterpret neutral situations as negative.
- Anguished:** Individuals with avoidant traits tend to feel angry and sad over their inability to connect with others and make their needs known. As a consequence, they vacillate between desire for affection and fear of rejection. Since they typically avoid conflicts due to their lack of assertiveness, they tend to experience a constant and confusing undercurrent of tension and sorrow.
- Vexatious:** Avoidant individuals tend to have conflict-ridden memories of problematic past relationships. They are seldom able to access gratitude or well-being, as pessimistic views of past interactions predominate for them.
- Excessively Imaginative:** Individuals with avoidant personality features tend to daydream, as they depend on imagination to gratify the needs they are often too anxious to live out in real life. They retreat into a fantasy world of their own making to build confidence and to experience the gratification that is otherwise off-limits to them, withdrawing into their reveries to safely discharge frustrated passions and impulses.
